Description

Our scientists, engineers and mathematicians come from some of the best and most respected institutions in the world, including Stanford, MIT, Oxford and NASA. Thanks to the new technology, avast has a game mode. The one that will allow you to take advantage of your video games without having to eliminate typical ads from any other threat detection. Avast has other functions such as: Intelligent Anti-Virus - Discover and block threats before affecting your device. What could be viruses, spyware, malicious software, ransomware. Wi-Fi Inspector - Finds the weak Web sites of your WI-FI home network as well as strangers who try to use it without permission. CyberCapture - The considered files will be sent immediately to the cloud. There they will analyze and see if they are threats, if they are, a solution will be thought out. Intelligent analysis - Any failure through which malicious software can enter is detected. Such as, outdated computer program, unsafe passwords, configurations and suspicious add-ons. Avast Passwords - Provides protection of all your passwords. You will not suffer any more because you forgot them, because this function only needs a password, with which you will administer all the others. In 2016 avast purchased AVG and together they protected more than 400 million devices worldwide.

Review

Avast is an antivirus program that uses the latest technology to combat cyber attacks that are taking place in real time. Avast's big goal is to **"defeat criminals,"** using its machine learning mode that, based on all the information we can find in a cloud, sees everything that happens on the Internet and constantly receives data from millions of users.

Launched in 1988 by the Czech company ALWIL Software, based in Prague, it was the first to launch software to end those harmful files that threaten the Internet. It combines antivirus and antispyware technology in the same program. Avast's innovative approach to security stems from the experience of its security engineers who are spread around the world. With more than 80 million users worldwide, it is one of the most famous programs. It is a **free application**, available for **Android and iOS**.

Of all the options that exist on the Internet, Avast is the fastest, it does not slow down our devices and it does not hinder their use. It is capable of detecting any threat before it affects the device,

making it the most effective on the market.

Its mobile version is not far behind, with more than 100 million users, it includes other very useful functions. If you have downloaded the application, you will only have to open it once the installation is finished, you just have to follow the three steps that indicate, press Start and the option Continue with the ads, to use its free version, all very easy and comfortable.

With Avast you will be able to activate the **Antivirus Engine**, which performs a scan of all the apps that you download on the device before you use them. It is as easy to do as programming this function indicating the parameters that must be followed and the system will do the rest, you can also do it manually. Whichever way you choose, at the moment it detects something strange, it will propose various solutions, such as uninstalling the application or deleting the damaged file.

It has a photo trunk in which you can save all your images and that they are hidden from third parties that you do not want to be able to access them. Avast also checks the web and all files to protect your most sensitive data.

Avast has eight protection modes: File System, Email, Web, P2P, Instant Messaging, Network, Behavioral, and Script. As a user, you decide which one you want to use, the more the protection covers, the safer your device will be. In addition to all this, it has an additional protection, **Autosandbox**, which guarantees the security of your browser and blocks those URLs that it considers malicious.

One of the novelties of Avast is **Anti Theft**, to protect the data of the phone or help in case it has been lost or stolen. It will automatically do a series of preventive actions, such as activating an alarm when it detects a strange movement that it does not recognize. In its Pro version, it adds three more options to increase protection, being much more effective, if your mobile has been robbed of this function by detecting that you are trying to change your SIM and without realizing it, the device will crash, take photos and will record the suspect's voice. This is very useful to be able to recover it.

Avast has a virtual private network, VPN, which allows you to hide everything you do and your movements online; It even lets you change the location of the phone so that no one knows where you really are. Likewise, if it detects an infected link, it automatically deletes it so that you do not have risks of clicking on it. Another feature of Avast is its ad blocker, without the need to install another specific application for it.

A very interesting feature of **Avast** is that it allows you to block ads in video games, so you will not have annoying interruptions while you play and you are sure that you will not have any threat.

In summary, downloading the **Avast** antivirus is one of the best options. Both to install on your mobile devices and on your PC. Try everything it has to offer and you don't want to change it for another one.
